

## ***Digital Color Balance Comments***

Digital files provided by our studio are saved in their native RGB format and color balanced using embedded "Adobe RGB (1998)" default color space.

As the default color space, these images should appear reasonably well color balanced with most monitors and desktop printing systems.

Since it is impossible to anticipate all potential variations of color calibration used by other users/viewers, it is conceivable that these images may need to be modified by the end user to best match their individual system.

If these images are applied to brochure or other four color press production, it is expected that all images, after being converted to CMYK standards, will be color balanced to comply with the specific work flow criteria mandated by the specifically selected ink / paper / press run.

Regardless of any method of reproduction, we do request all images bear our identification as "© 2003 Expressive Images Ltd." and that all copyright laws are honored.

If there are any specific questions concerning the images provided, please feel free to contact us.

Thank you for allowing us to serve you.

Respectfully,

Gary L. Behr, CPC
